B. Tech.

(SEM. VIII) EXAMINATION, 2008-09 ADVANCE COMPUTER ARCHITECTURE

Time: 3 Hours]

[Total Marks: 100

- Note:
- (1) Attempt all questions.
- (2) All questions carry equal marks.
- (3) Be precise in your answer.
- (4) No second answer book will be provided.
- 1 Attempt any two parts of the following:
 - (a) Define parallel computing. What are the fundamental issues in parallel processing? Why parallel computing is required? Discuss various applications of parallel computing.
 - (b) Explain how degree of parallelism (DOP) and number of processors affect the performance of a parallel computing system. Discuss various speedup performance laws.
 - (c) Explain Flynn's classification of computer architecture and how it is Feng's classification?

- 2 Attempt any two parts of the following
 - (a) What do you understand by pipelining? Explain it. What are hazards that occur in pipelining in your opinion. Explain it.
 - (b) What do you understand by linear and non-linear pipeline processors? Explain them.
 - (c) Discuss memory hierarchy technology. Explain inclusion, coherence and locality properties.
- 3 Attempt any two parts of the following
 - (a) Explain about array computers and pipeline computers.
 - (b) Explain the following
 - (i) Neural architecture
 - (ii) Associative processors
 - (iii) Systolic architecture.
 - (c) Explain the structural and operational differences between register-to-register and memory-to-memory architecture in building multi-pipelined super computers for vector processing. Comment on the advantages and disadvantages in using SIMD computers as compared with the use of pipelined super computers for vector processing.
- 4 Attempt any two parts of the following:
 - (a) What do you understand by PRAM algorithms?

 Discuss and explain with suitable example about the PRAM algorithm for merging two sorted lists.

- (b) Prove that the best parallel algorithm written for an n-processor EREW PRAM model can be no more than O (log n) times slower than any algorithm for a (CRCW) model of PRAM having the same number of processors.
- (c) Explain the following terms related to shared-variable programming on multiprocessors:Multiprocessing in MIMD mode.

5 Write short notes on any two:

- (a) Conditional compilation
- (b) Run-time library routines
- (c) Master and synchronization constructs.
